Everything you need to grade at scale

Purpose-built for Computer Science courses, BatchGrade handles the repetitive evaluation work so you don't have to.

Automated Test Runner

Define test cases once and apply them to every submission automatically. Consistent, objective evaluation every single time.

Batch Processing

Upload an entire class's worth of submissions at once. BatchGrade evaluates all of them simultaneously, cutting grading time by hours.

Cross-Platform

Native desktop app for Windows, macOS, and Linux. Works wherever your students submit their code.

Fully Local & Private

Student data never leaves your machine. No cloud accounts, no data agreements, no privacy concerns ever.

Grade Management

A built-in SQLite database keeps all grades organized and accessible. Export results to your spreadsheet or LMS with ease.

Structured Feedback

Each student receives clear, actionable feedback alongside their grade not just a score, but guidance on how to improve.

Installation

Download the installer for your platform (Windows, macOS, or Linux) and run it. No accounts, no cloud setup, no configuration required.

Submissions

Point BatchGrade at the folder of student submissions and configure your test suite once. BatchGrade supports multiple programming languages and testing frameworks.

Running

Click Run. BatchGrade evaluates every submission, generates per-student feedback, and stores the results. Export grades directly to your spreadsheet or LMS.

About

Grading should take minutes, not night.

Programming instructors spend enormous amounts of time manually running and checking student code. BatchGrade eliminates that bottleneck by automating the repetitive parts of evaluation so educators can focus on the parts that actually require human judgment.

Privacy is non-negotiable. The base desktop version runs locally, keeping student submissions on the instructor's machine while the team continues to plan future hosted workflows carefully.

The base version is planned to remain free to use, while the team explores a future SaaS offering for instructors and departments that want hosted workflows, collaboration, and managed infrastructure.

FAQ

● What programming language dose BatchGrade support?

BatchGrade currently supports Python, Java, C, and C++. Additional language support is planned for future releases.

◆ Can I use a custom test runner or testing framework?

Yes. BatchGrade supports custom test runner configurations via the test config file. You can specify a custom command that BatchGrade will execute for each submission.

▲ How do I update BatchGrade?

BatchGrade checks for updates on launch. You can also download the latest release manually from the GitHub releases page at any time.
